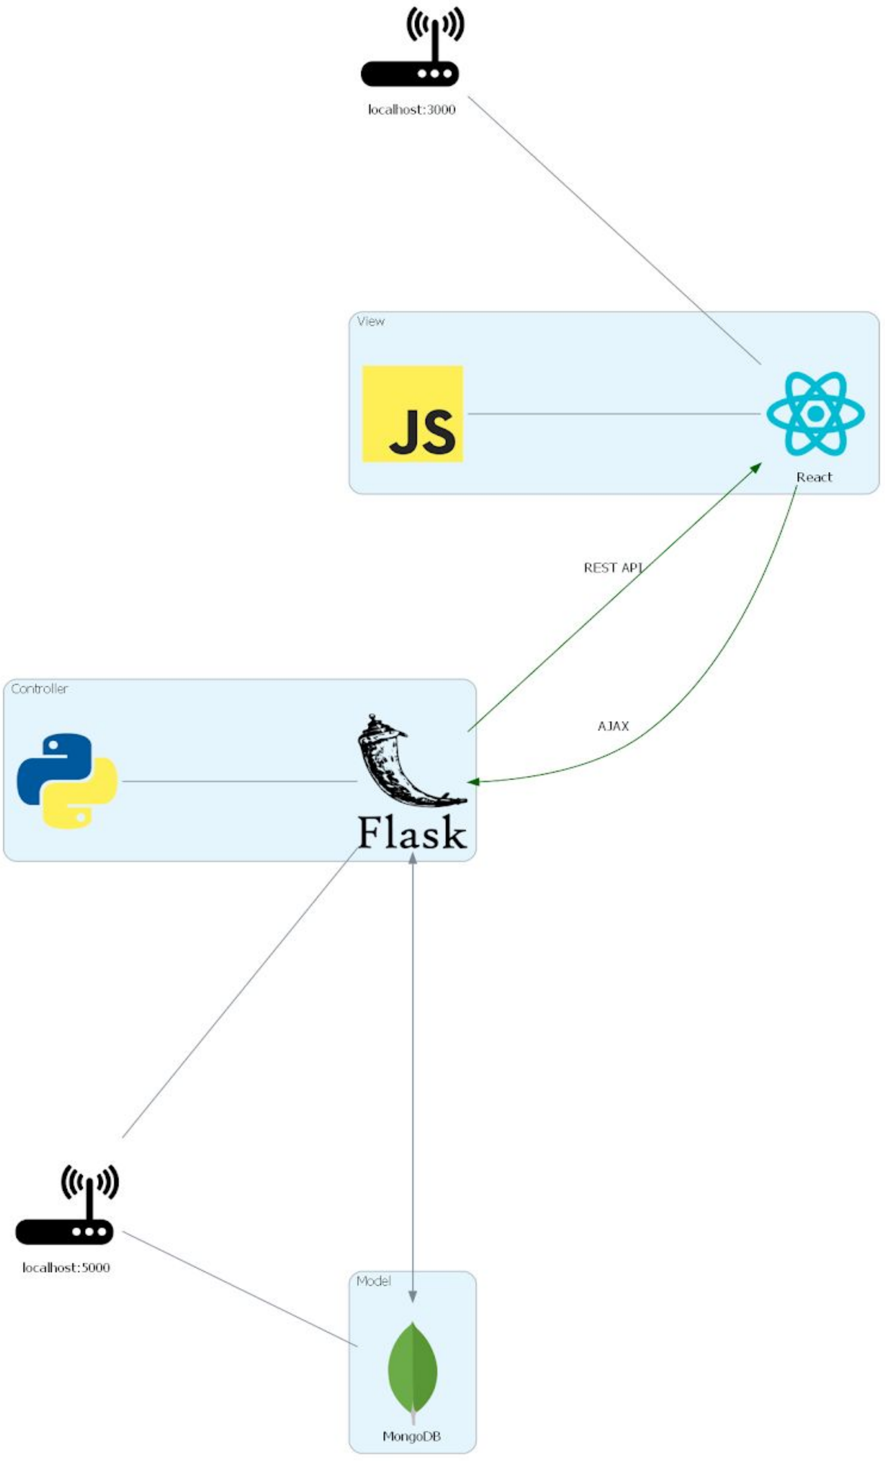
Table of Contents:

System Architecture



Architecture

CRC Cards

NOTES:

- Model represents the data in code.
- Database holds the data.
- Schema implies that the class is responsible for saving its information to the database

Class name: **UserController**
Responsibilities:

- Get all user information
- Receives user information for storage in database
- Delete user from database

Collaborators:

- UserModel

Class name: **UserModel**
Schema:

- email
- pass
- name
- phone
- roles -- replaces Access in the template code -- [“Student”, “Instructor”, “Organization”]

Responsibilities (if any):

- Generating a password hash
- Check the password hash
- Saves user information to the database

Collaborators:

- UserController

Class name: **OpportunityController**
Responsibilities:

- CRUD Opportunities
- Query for volunteer opportunities

- Query for paid opportunities (jobs)
- Query for list of applicants to opportunity
- Receive an application from a Student

Collaborators:
- OpportunityModel

Class name: **OpportunityModel**
Schema:
- isPaid (boolean)
- description
- applicants
- organization user

Collaborators:
- OpportunityController

Class name: **CourseController**
Responsibilities:
- CRUD course
- CRUD course content
- Get all courses taught by a particular instructor
- Get all courses containing a particular student
- Get all courses endorsed by a particular organization
- Get all courses used for training by a particular organization
- Enrol Students in courses
- Drop Students from courses
- Add/Remove endorsements by organizations
- Add/Remove courses as training for organizations

Collaborators:
- CourseModel
- ContentController

Class name: **CourseModel**
Schema:
- name - text

- objective - Text field
- learningOutcomes - Text field
- instructor - id
- students - list of student user ids
- endorsedBy - list of organization user IDs
- trainingFor - list of organization user IDs
- published (whether the course can be enrolled in or not)
- courseContent - list of content ids

Collaborators:
- CourseController

Class name: **CourseContentController**
Responsibilities:
- Know its ID

Collaborators:
- ContentModel
- CourseController
- AssignmentController
- QuizController
- VideoController
- EmbeddedTextController

Class name: **CourseContentModel**
Schema:
- name

Collaborators:
- ContentController

Class name: **AssignmentController**
Responsibilities:
- Get assignment average
- Get all submissions
- CRUD assignment file / UploadFormat

Collaborators:

- ContentController
- AssignmentModel

Class name: **AssignmentModel**
Schema:
- dueDate
- studentGrades
- studentSubmissions
- uploadFormat
- assignmentFile (for download)

Collaborators:
- AssignmentController

Class name: **QuizController**
Responsibilities:
- Get quiz average
- CRUD quiz-questions
- Set timer
- Get submissions

Collaborators:
- ContentController
- QuizModel

Class name: **QuizModel**
Schema:
- quizQuestions
- quizTimer
- studentGrades
- studentSubmissions
- quizSubmit

Collaborators:
- QuizController

Class name: **VideoController**
Responsibilities:
- CRUD url

Collaborators:
- ContentController
- VideoModel

Class name: **VideoModel**
Schema:
- url

Collaborators:
- VideoController

Class name: **EmbeddedTextController**
Responsibilities:
- CRUD text content

Collaborators:
- ContentController
- EmbeddedTextModel

Class name: **EmbeddedTextModel**
Schema:
- Used for articles / readings / random shit

Collaborators:
- EmbeddedTextController

Class name: **React**
Responsibilities:
- Gets all data from server
- Sends data to server
- Is pretty :) <3

Collaborators:
- *Controller

Design Patterns

Application Factories

https://flask.palletsprojects.com/en/1.1.x/patterns/appfactories/

- Provide a malleable structure to our application configuration
- Allows use of different settings in different environments
- Improves testing by allowing different settings for different test cases
- Can run multiple instances of the application in one process

High Order Functions / Decorator Functions

- Allows writing class methods with single purpose in mind (serving resources) instead of constantly rewriting code for authentication, command creation, etc.
- Allows dynamic authentication requirement assignment at run time in a flexible way (not tied to a subclass structure)
- Examples:
    - @jwt_required() to authenticate api routes on flask server
    - @click.command('cmd') to create commands usable in CLI

Application Structure

Frontend Architecture:

- Courses -- Components that represent interacting with courses (creating courses, listing available courses, etc.)
- Course Content -- Components that represent interacting with course content like videos, quizzes, assignments
- Landing -- Components that represent the landing page on the website (home page, login, sign up)
- Dashboards -- Pages which collect a bunch of components to provide a more unified UI
- Jobs -- Components that represent interacting with job and volunteer opportunities
- App -- Root component. Provides a router for all urls on the react application and serves relevant components for those urls (Courses.js, Home.js, etc.)

Structure:
Public folder: holds files that are served at the root of the single page

- Favicon.ico - is the icon that appears in a chrome tab
- Index.html - root html file that servers the built javascript from React
- Robots.txt - relevant for preventing webscrapers, not important for our purposes
- Manifest.json - more icon settings / config

Src folder:

- Courses -- Holds components and relevant files that represent interacting with course content
    - Courses.js -- overall view for a list of courses and creation
        - Holds CourseList & CreationForm components
    - CourseList.js -- view of a list of courses and an add new course option
    - CreationForm.js -- view of form for creating courses
- Landing -- Holds components and relevant files that represent the landing page on the website

    - Home.js -- view for the website homepage
    - About.js -- view for additional information about the homepage
- App.* -- root component, test and css files

  Provides a router for all urls on the react application and serves relevant components for those urls (Courses.js, Home.js, etc.)
- index.js root javascript file provides App.js
- index.css root css file, affects styles of all other components

Package.json -- holds information on relevant node dependencies as well as describes the npm commands that are available (npm start, npm test)

Backend Architecture:

- Controllers and Models as described in CRC Cards

Structure:
Backend root:

- .flaskenv -- settings to be used in the virtual environment pertaining to flask. Since python-dotenv is installed, the python environment has access to the .env files (which are necessary for running flask commands)
- README.md -- explaining parts of the backend service that are more complicated and links to relevant documentation
- requirements.txt -- dependencies for a prod environment
- setup.py -- setting up dependencies and ensuring that development environment meets certain version requirements

uimpactify -- project folder:

- controller -- files pertaining to the controller of the MVC structure
    - routes.py -- defines all api routes made available by the server and links them to specific controller classes
- models -- files pertaining to the model of the MVC structure
- __init__.py -- creates the application factory and a default configuration to create a basic development environment
- api.py -- creates some flask commands to run some API requests pythonically (login, signup, etc.)

- db.py -- defines a init-db command to create an admin user on the database. Also defines methods for getting and setting the global database object available in the flask app
